LAB REPORT
on

Machine Learning (23CS6PCMAL)

Submitted by

Ganesh Bhandari (1BM22CS098)

in partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING
(Autonomous Institution under VTU)
BENGALURU-560019
Sep-2024 to Jan-2025

B.M.S. College of Engineering,
Bull Temple Road, Bangalore 560019
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled "Machine Learning (23CS6PCMAL)" carried out by **Ganesh Bhandari (1BM22CS098),** who is bonafide student of **B.M.S. College of Engineering.** It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Machine Learning (23CS6PCMAL) work prescribed for the said degree.

Supreeth S Assistant Professor Department of CSE, BMSCE	**Dr. Kavitha Sooda** Professor & HOD Department of CSE, BMSCE

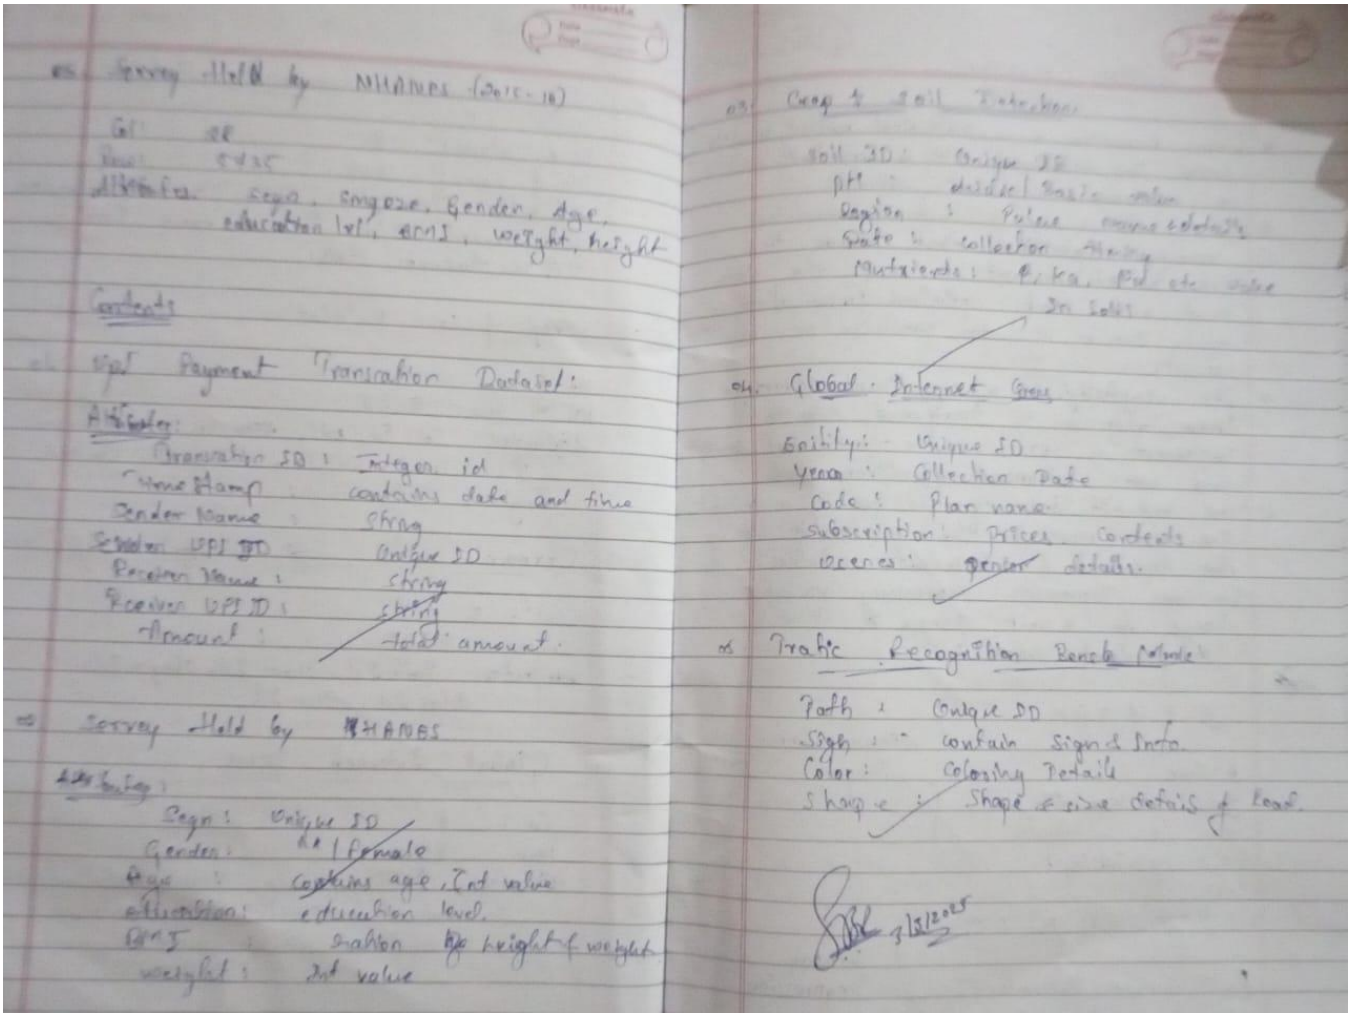
Program 1

Write a python program to import and export data using Pandas library functions

Screenshot:



Code:

```
import pandas as pd
# ---------- Step 1: Import Data from CSV ----------
# If you already have a CSV file, replace 'data.csv' with the filename.
# For this demo, let's create a DataFrame and save it to CSV first.
data = {
    'Name': ['Alice', 'Bob', 'Charlie'],
    'Age': [24, 30, 22],
```

```
    'City': ['New York', 'Los Angeles', 'Chicago']
}
# Create DataFrame
df = pd.DataFrame(data)
# Exporting DataFrame to CSV
df.to_csv('people.csv', index=False)
print("Data exported to 'people.csv'.")
# ----------- Step 2: Import Data from CSV -----------
imported_df = pd.read_csv('people.csv')
print("\nData imported from 'people.csv':")
print(imported_df)
# ----------- Step 3: Export Data to Excel -----------
df.to_excel('people.xlsx', index=False)
print("\nData exported to 'people.xlsx'.")
# ----------- Step 4: Import Data from Excel -----------
imported_excel_df = pd.read_excel('people.xlsx')
print("\nData imported from 'people.xlsx':")
print(imported_excel_df)
```

OUTPUT:

```
Data exported to 'people.csv'.

Data imported from 'people.csv':
      Name  Age         City
0    Alice   24     New York
1      Bob   30  Los Angeles
2  Charlie   22      Chicago

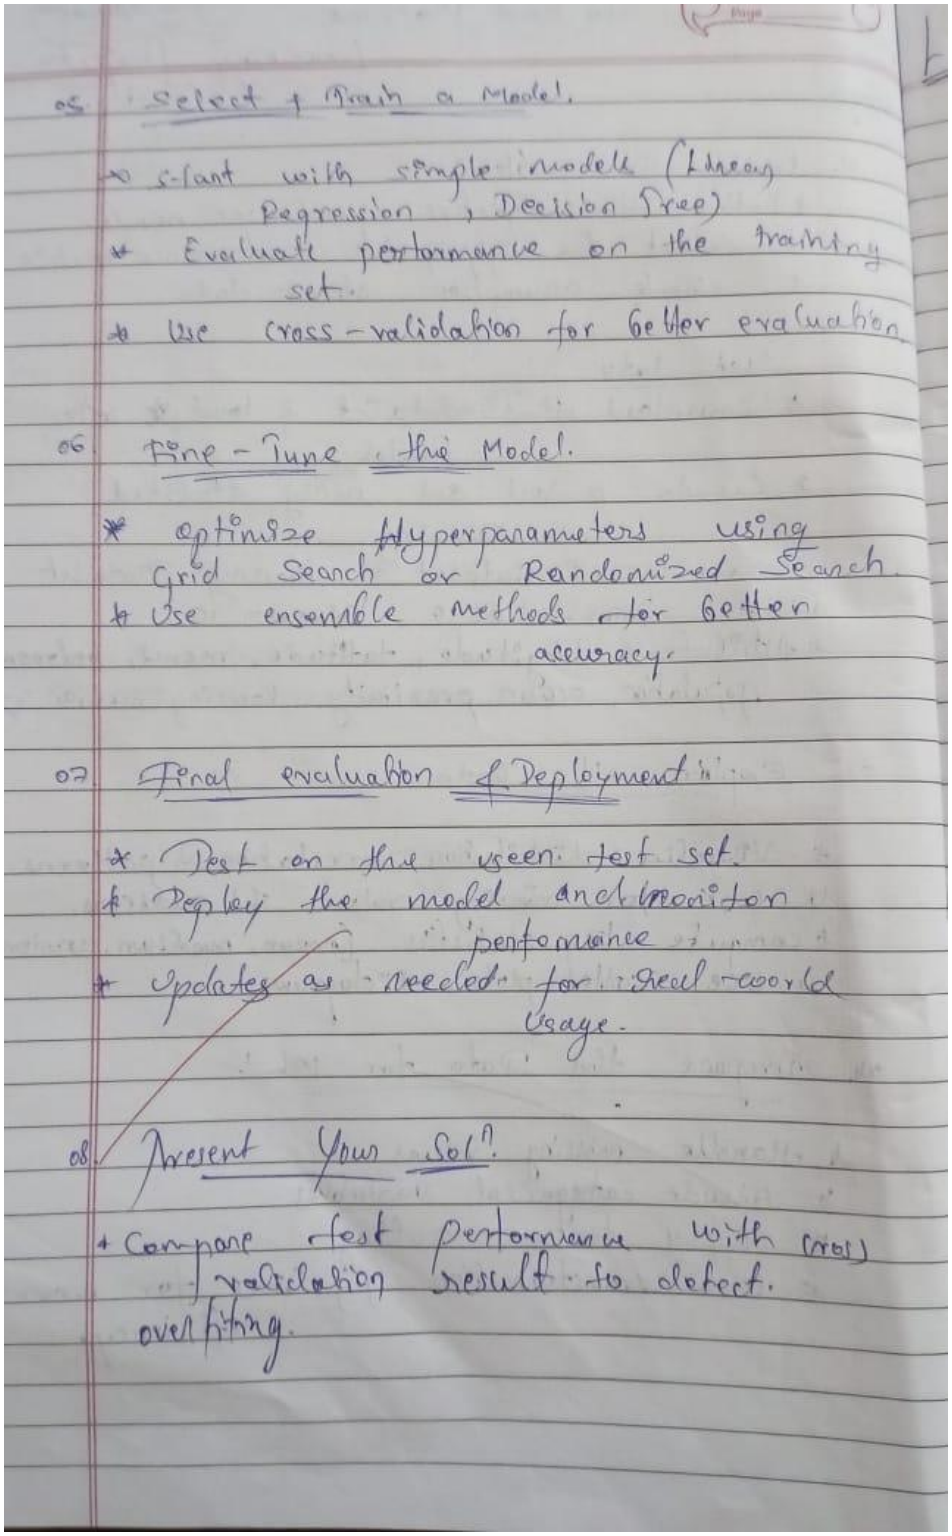
Data exported to 'people.xlsx'.

Data imported from 'people.xlsx':
      Name  Age         City
0    Alice   24     New York
1      Bob   30  Los Angeles
2  Charlie   22      Chicago
```

Program 2

Demonstrate various data pre-processing techniques for a given dataset

Screenshot:



Lab-3

End to End Machine Learning Project

Steps:

01. Frame the problem:
* Define the objective from user needs.
* Select the appropriate performance metric
* Check assumptions about data.

02. Get data
* Download that dataset & load it into Pandas.
* Create a test set using stratified sampling.
* Here used dataset = Housing Dataset
* Total Rows: 20640, Columns = 10
* Attributes = longitude, latitude, rooms, bedrooms, population, ocean proximity, housing median age

03. Explore the Data
* Visualize distribution, correlation & patterns.
* Look for missing values & outliers.
* compute key statistics (mean, median, variance)
* Use scatter plots, histograms.

04. Prepare the Data for ML:
* Handle missing values
* Encode categorical variables
* Apply feature scaling.
* Use transformation pipelines for more efficiency.

Code:

```
from google.colab import files
diabetes=files.upload()

from google.colab import files
adult_income=files.upload()

df1=pd.read_csv("Dataset of Diabetes .csv")
df1.head()

df2=pd.read_csv("adult.csv")
df2.head()

```

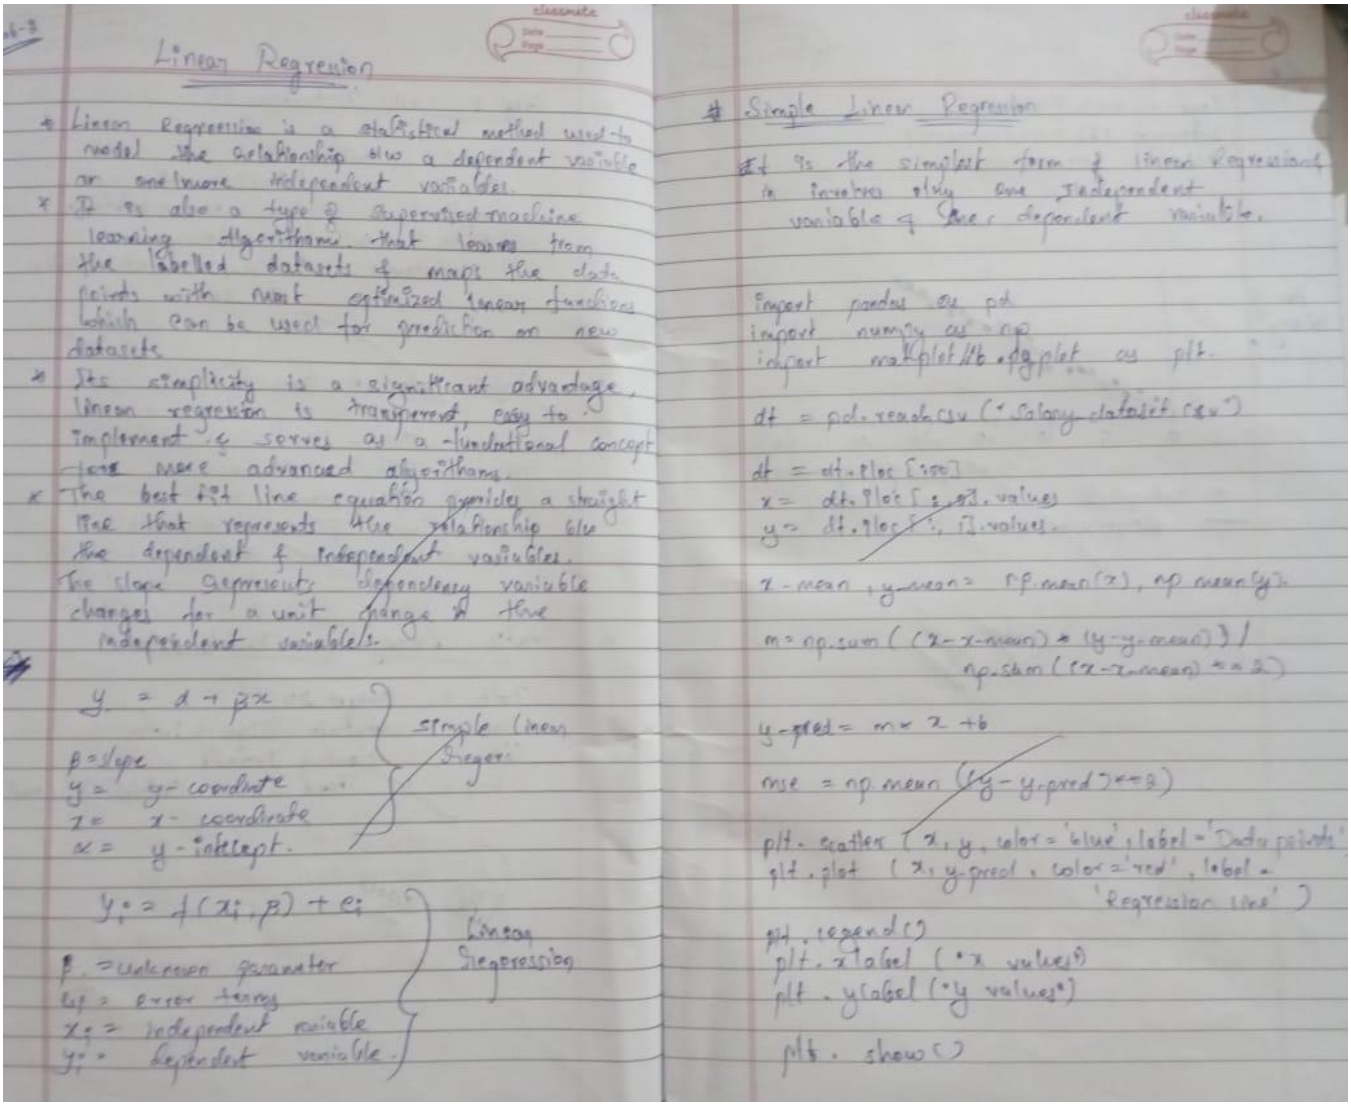
Program 4

Implement Linear and Multi-Linear Regression algorithm using appropriate dataset

Screenshot



Linear Regression

* Linear Regression is a statistical method used to model the relationship b/w a dependent variable or one/more independent variables.
* It is also a type of supervised machine learning algorithms that learns from the labelled datasets & maps the data points with most optimized linear functions which can be used for prediction on new datasets.
* Its simplicity is a significant advantage. linear regression is transparent, easy to implement & serves as a fundational concept for more advanced algorithms.
* The best fit line equation provides a straight line that represents the relationship b/w the dependent & independent variables. The slope represents how dependency variable changes for a unit change in the independent variable(s).

$y = \alpha + \beta x$ — Simple Linear Regression

β = slope
y = y-coordinate
x = x-coordinate
α = y-intercept.

$y_i = f(x_i, \beta) + e_i$ — Linear Regression

β = Unknown parameter
e_i = error terms
x_i = independent variable
y_i = dependent variable.

Simple Linear Regression

It is the simplest form of linear regression it involves only one independent variable & one dependent variable.

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt

df = pd.read_csv('Salary_dataset.csv')

df = df.iloc[:30]
x = df.iloc[:, 0].values
y = df.iloc[:, 1].values
